How to turn old phone camera into webcam. How to turn your old android phone into a webcam.

(Image credit: Shutterstock / Mila Pashkovets) Two years ago, "Zoom fatigue" wasn't even a thing, but today it's a reality accepted by everyone. However, could having your business webcam (opens in new tab) on during meetings and calls be beneficial? According to Zoom, (perhaps unsurprisingly) it very much can. In fact, a recent survey of US workers by the video conferencing giant found that keeping the camera on during these calls positively impacts not only employees, but entire teams, as well as businesses as a whole. By analyzing the effects of keeping the camera on, Zoom had found that the vast majority of managers (64%) were more confident in their hiring decisions, if the candidate kept the camera on during the interview. Better together Having a camera on meant that people felt more connected to the task they were assigned, the report found, and they were able to work more broadly, while managers felt their direct reports were more engaged. Asides from individual workers, the wider team also stands to gain, including possibly the most obvious way - better collaboration (opens in new tab). Roughly four in five (79%) of those surveyed said they feel their colleagues pay attention when the video is on, while three-quarters claim the quality of the conversation is better that way. Finally, more than half (59%) believe their team-building efforts were more effective, keeping teams on better terms. Video on as mandatory policy Zoom notes that a business as a whole can benefit from video conferencing, too. It creates more trust with both potential and current clients, and makes closing a deal more likely. Finally, almost two-thirds (61%) of professionals feel they perform better with video on. Even though the majority of the respondents agree "video on" brings numerous benefits all around, very few believe it should be a mandatory company policy. Zoom seems to agree, though, as the report concludes that "not every interaction has to be a video call". "Having a communications ecosystem in place to support flexible business collaboration - and all the ways people want to communicate - will set you up for success," it concludes. Best hybrid working tech: Everything you need for the return to the office You must install a mobile app on your Android and the client software on your PC. Turn on developer mode and enable USB Debugging in Settings > Developer Options > USB Debugging. The PC and phone must be connected to the same Wi-Fi network for a wireless connection. This article will explain how to use your Android phone as a webcam on your computer. While many laptops, tablets, and 2-in-1 computers come with a webcam built-in, it's not the case for desktop computers. It means either you must purchase a webcam separately, or you will need to use a comparable device to set up a makeshift video camera. One way is to use your smartphone and its built-in camera. You can connect your Android phone to your computer, using either a wired or wireless connection, which then allows the computer to access your phone's camera. You can also choose between your device's front or rear camera. If you intend to use a wired connection, you'll need the proper USB cord to connect your phone and computer. If you're planning to use a wireless connection, you will need to ensure the phone and computer are connected to the same network. You need to install an app on both the phone and computer. Unfortunately, there is no way to set up a stable connection between your computer and your Android phone without using a third-party app. The good news is you have several options when connecting your phone. While most apps utilize a wireless connection, requiring your phone and computer to be on the same Wi-Fi network, some will also allow you to connect by plugging in a USB cable. You can connect your phone to your computer using a compatible USB cable, so you can access the camera feed. Using a USB cable also keeps power flowing to the mobile device. Before we begin, there are a few things to note: The app we recommend using is DroidCam. DroidCam includes free and paid versions. The free version allows low-quality video connections, but works just fine. With everything set up, now you can connect your Android phone and use it as a wired USB webcam. Here's how to access the phone's camera on your computer: On your Android phone, ensure USB Debugging is turned on in Settings > Developer Options > USB Debugging. Open the DroidCam mobile app (on your phone). It will ask for permission to access your device camera and microphone. Tap Allow for both prompts. Before connecting the computer and phone, tap the camera icon in the top right (of the app) and choose Front for the front camera. If you do not do this, you will see the rear camera when the connection is active. Start the DroidCam client software on your computer, and then connect a compatible USB cable to your phone and PC. You will see a notification pop-up on your phone asking for permission to Allow USB Debugging. Tap Allow. In the desktop application, click the USB icon to connect your phone with a USB cable. Also, make sure the boxes next to Video and Audio are ticked. You should see the name of your device in the connection field. If you do not see it, you may have to hit the refresh button and then select it in the dropdown. When you're ready, click Start. It may take a few seconds for the applications to sync, but you should see your camera feed on your computer once the connection is successful. Once connected, your computer will continue displaying the camera feed from your phone, and you can select the camera in video apps. The display will eventually turn off on your phone to preserve power, but the camera feed will remain active. You must always launch the DroidCam mobile app and software, and connect the feed, before starting any conferencing or video chat tools, like Zoom. Otherwise, the conferencing software will not recognize the external camera. Using the same application(s), you can also connect your phone to your computer over your home Wi-Fi network. Granted, both your computer and your phone must be connected to the same network. If you don't want to use a USB cable or wired connection, you can always sync the computer and phone wirelessly over Wi-Fi. Both devices must be connected to the same local network. Here's how to show the phone's camera feed on your computer: Whether you are connecting via USB (wired) or wirelessly, steps 1-3 are nearly identical. You may not have to repeat the process if you've done it already, such as when you're giving the app permission to access your camera and mic. Always start the DroidCam mobile application first. Give the app permission to access your camera and microphone if requested. Tap Allow for both prompts. If you've already done this before you shouldn't have to do it again, and may skip this step. Before setting up the Wi-Fi connection, tap the camera icon in the top right (of the app) and choose Front for the front camera. If you do not do this, you will see the rear camera when the connection is active. Start the DroidCam desktop client. Leave the first option (a Wi-Fi icon) selected. In the mobile app (on your phone), you will see IP and port information labeled as WiFi IP and DroidCam Port. Enter the information exactly as shown in the respective fields on the PC client. Make sure the Video and Audio fields are also checked. Then click Start when you're ready to connect. It may take a few seconds for the applications to sync, but you should see your camera feed on your computer once the connection is successful. Be sure to prop your phone up on a stand so the video is stabilized! You might also consider installing some better lighting or using a selfie ring light. FAQ How do you use your phone as a webcam for Twitch? On your Android device, download the CamON Live Streaming app, then launch the app, select the camera you want to use, and choose your feed quality. Using a browser or media source, import the feed into your broadcasting software, then follow your broadcasting software's prompts. How do I use an iPhone as a webcam? To use your iPhone as a webcam, you'll need to download the EpocCam app to your iPhone, then launch the app and allow it to access your mic and camera. On your Mac, download the EpocCam app from the Mac App Store, then launch the app. Make sure your Mac and iPhone are on the same Wi-Fi network; they'll connect automatically, and you'll see the live feed from your iPhone on your Mac. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! Webcams are now a ubiquitous part of laptops, but some users might want to turn them off because of security concerns. While it's infrequent, some malware can actually access computers' webcams and quietly spy on users. In 2014, several people were arrested in the United Kingdom for spreading that kind of software. There are several ways to ensure that your computer's webcam is behaving the way it should. MORE: How to turn your laptop into a home security system Download and Run Antivirus/Anti-Malware Software While this should be a normal part of maintenance for any Windows user, it's one way to ensure that no malware is attempting to hijack your webcam. Popular free options for security software include Avast and Malwarebytes. In addition, practicing normal, safe Internet usage habits (not opening unfamiliar email attachments, etc.) is also advised. Turn Off the Webcam Completely 1. Open the Start menu or (on Windows 8) the Start screen. 2. Type Device Manager into the search field and select the first result, which should open Windows' Device Manager. 3. Locate Imaging Devices, which should display any webcams installed, under the Device Manager. 4. Right click on your webcam and select Disable. A pop-up window will appear to confirm this choice; click Yes and close the windows. Your webcam will now be turned off. If you ever need to use the webcam, follow the above steps, but select Enable when right clicking on your webcam. Put Tape Over the Webcam This final method is rather low-tech, but works if you can't or don't want to mess with software or your computer's settings. Simply put a piece of duct tape or masking tape over the lens. The downsides, of course, are mainly aesthetic, including sticky residue possibly left behind if the tape is removed.
